

Gemini Pro

Enterprise Multimedia Workflows

Day 2 - Session 10

Prerequisites

Confirm these prerequisites:

- A Google account with access to Gemini and Google Workspace
- Access to the course's Gemini Notebook and Google Workspace features used in the sessions
- Prepared or non-sensitive material for classroom activities

Introduce Yourself

In one chat message, type:

1. Your name
2. Your location or time zone
3. Your role
4. Your total experience in information technology (IT) and at your current organization

Type your answer in the chat, but do not send it yet.

Wait for the countdown: 3... 2... 1... BLAST

Your Enterprise Gemini Experience

In one chat message, type:

1. Your current experience with Gemini, Gemini Notebook, and Google Workspace
2. Your main focus area, such as financial services, operations, manufacturing, or another work area
3. One enterprise workflow challenge or question you want answered by this course

Type your answer in the chat, but do not send it yet.

Wait for the countdown: 3... 2... 1... BLAST

Your Enterprise Gemini Experience: What We Learned

Your responses help us emphasize:

- **Your starting point:** Enterprise media creation, source-grounded presentations, and Gemini Notebook research
- **Your focus area:** Evidence, governance, collaboration, or repeatable Workspace workflows
- **Your key questions:** Source selection, review gates, synthesis, and responsible multimedia generation

Compare your response with these themes and note one topic to revisit.

What We'll Cover

1. Analyze images, audio, music, and video
2. Generate, edit, and sequence consistent visual stories
3. Create Audio Overviews, voiceovers, and music
4. Produce video with Gemini Apps and Google Vids
5. Govern media and launch Breakout Lab 2.1

One Ecosystem, Several Surfaces

Choose the product that matches the workflow

This Extends Session 4

Session 4 focused on analysis:

- Inspect existing videos, screenshots, and flowcharts.
- Verify timestamps and visible evidence.

This session adds creation:

- Generate images, speech, music, and video.
- Add enterprise approval, provenance, and publishing controls.

Choose the Right Surface

Surface	Best fit
Gemini Apps	Individual analysis, ideation, and draft assets
Google Vids	Collaborative workplace video production
Enterprise Agent Platform	Governed APIs, applications, and scaled pipelines

A “Pro” model or plan does not make every feature available everywhere.

Choose the Right Surface

Capability Map

Need	Typical surface
Analyze files and media	Gemini Apps or an enterprise API
Generate or edit images	Gemini Apps, Vids, or enterprise models
Create narration or an audio briefing	Audio Overviews, Vids, or Gemini Audio
Generate music	Gemini Apps, Vids, or Lyria APIs
Create video	Gemini Apps, Vids, or Veo and Omni APIs

The Enterprise Question

Do not start with “Which model should we use?”

Start with:

1. What business artifact is needed?
2. Which approved sources may inform it?
3. Who must review it?
4. Where will it be stored and published?

Analyze Existing Media

Extract evidence before generating new assets

Supported Analysis Patterns

Gemini Apps can work with supported documents, spreadsheets, notebooks, photos, audio, and video.

Use it to:

- Describe and compare media.
- Transcribe, summarize, or extract claims.
- Identify moments with approximate timestamps.
- Turn observations into a structured review queue.

Images and Screenshots

Ask Gemini to separate:

- **Observation:** Visible text, objects, controls, colors, or layout.
- **Interpretation:** Meaning, intent, usability, quality, or risk.
- **Unknown:** Cropped, blurred, occluded, or unreadable content.
- **Action:** A review step tied to visible evidence.

Never infer sensitive traits from an image.

Audio and Music Analysis

Possible tasks include:

- Transcription and translation
- Speaker separation and segment summaries
- Timestamped questions about a recording
- Detection of speech tone or non-speech sounds
- Structural discussion of music

Treat identity, emotion, lyrics, and quotations as claims to verify.

Video Analysis

Request a review table with:

1. Approximate timestamp
2. Visible or audible evidence
3. Interpretation
4. Confidence
5. Human verification result

Fast motion, small text, cuts, and overlapping audio can be missed.

A Reusable Analysis Prompt

Analyze this [media] for [business purpose].
Separate direct observations from interpretations.
For each finding, cite a timestamp or visible region,
state confidence, and mark anything unreadable or uncertain.
Do not infer identity, intent, or sensitive attributes.
Return a review table for a human approver.

Media Review Queue (Fintech)

REAL-WORLD SCENARIO

Fintech (JPMorgan Chase: Contract Intelligence):

- Reviewers can use document analysis to extract clauses, obligations, and renewal dates from a controlled contract set.
- A human review queue checks each cited passage before a relationship manager relies on the finding.

Media Review Queue (Manufacturing)

REAL-WORLD SCENARIO

Manufacturing (Siemens: Industrial Copilot):

- Engineers can analyze maintenance manuals, machine photos, and service recordings to locate an abnormal condition.
- The work order retains the source reference and technician verification instead of treating the model observation as a diagnosis.

Create and Edit Images

Move from a vague request to a reviewable visual brief

Image Capabilities

Nano Banana 2 in Gemini Apps supports:

- Image generation and conversational editing
- Multiple reference images for a new composition
- Variants for different formats and audiences
- Product mockups, diagrams, and storyboards

Paid subscribers can also regenerate with Nano Banana Pro. Availability depends on the account and surface.

Build an Image Brief

Specify:

1. Business purpose and audience
2. Subject, setting, and composition
3. Style, lighting, and aspect ratio
4. Required text and brand constraints
5. Elements to exclude
6. Acceptance and review criteria

Image Review Gate

Before external use, verify:

- Product and factual accuracy
- Spelling and rendered text
- Trademarks, logos, and likeness rights
- Representation and accessibility
- Brand and legal approval
- Provenance and disclosure requirements

Visual Asset Workflow (Retail)

REAL-WORLD SCENARIO

Retail product launch:

- Generate background concepts around an approved product image.
- Reject any output that changes the product, packaging, or label.
- Test crops for web, mobile, and social placements.
- Route selected variants to brand, accessibility, and legal review.

Advanced Visual Storytelling

Keep characters, worlds, and themes stable across many assets

Why One Prompt per Image Drifts

Each isolated generation can reinterpret:

- The character's face, age, clothing, or proportions
- A product's shape, color, label, or scale
- The location, palette, lighting, or art direction
- Recurring props and their positions

Treat a sequence as one production system, not several unrelated prompts.

Start with a Story Bible

Lock across every asset	Change scene by scene
Character and product identity	Action and expression
Wardrobe and signature props	Shot size and camera angle
World rules and color palette	Location within the world
Rendering style and aspect ratio	Time, weather, and motion

Approve the locked column before generating the sequence.

Master Prompt: Mina and Orbit

Visual story bible – preserve in every frame:
Mina: South Asian field engineer, early 30s; shoulder-length wavy black hair; round teal glasses; mustard field jacket; navy backpack; small silver compass pin.
Orbit: palm-sized white spherical inspection drone with one cyan ring light; no text, face, arms, or logos.
World: optimistic solar-powered railway; teal-and-gold palette; soft gouache illustration; natural proportions; 16:9 landscape.
Never change identity, wardrobe, signature props, palette, rendering style, or aspect ratio unless the scene delta says so.

One Story, Four Clear Frames

Frame	Scene delta	Story beat
1	Wide shot; Mina arrives at a dark station	A problem appears
2	Close-up; Orbit scans a broken solar panel	The clue is found
3	Medium shot; Mina reconnects one cable	The repair works
4	Wide sunset; station lights glow behind them	The world changes

The story bible stays fixed; only the scene delta changes.

Build an Anchor Pack First

1. Generate one neutral full-body character reference.
2. Generate front, side, and three-quarter views.
3. Add expression, wardrobe, product, and prop references.
4. Approve one style frame for palette, texture, and lighting.
5. Reuse approved images as references where the surface allows.

A verbal description helps; references reduce ambiguity but cannot guarantee continuity.

Prompt Each Shot as a Delta

Use the approved story bible and reference images.
Frame 2 of 4 – clue:
Close-up at platform level. Orbit projects a cyan scan across one cracked solar panel while Mina studies the result.
Continuity: same identity, wardrobe, compass pin, drone design, station architecture, teal-and-gold palette, and gouache style.
Do not add people, logos, text, tools, or new costume details.
Return one 16:9 image with clear space at lower right for captions.

Describe what changes; repeat what must not change.

Use a Continuity Ledger

Check	Frame 1 truth	Reject when
Mina	Teal glasses, mustard jacket, compass pin	Any item changes or disappears
Orbit	White sphere, one cyan ring, no face	Limbs, text, or a face appears
World	Teal-gold gouache railway	Palette or medium shifts
Geography	Panel sits left of platform clock	Spatial relationship flips

Record accepted truths early so reviewers compare evidence, not memory.

Continuity Ledger (Fintech)

REAL-WORLD SCENARIO

Fintech (Capital One: Eno):

- A conversational assistant can keep approved product terms, escalation language, and customer context consistent across repeated service interactions.
- A continuity ledger for prompts and approved responses helps reviewers catch drift before a customer-facing update is published.

Continuity Ledger (Manufacturing)

REAL-WORLD SCENARIO

Manufacturing (BMW Group: AIQX visual inspection):

- Quality teams can keep inspection criteria, part identity, and camera placement stable across repeated production-line images.
- Accepted reference frames and a defect ledger make visual drift visible before a changed model is used for quality decisions.

Story Continuity Loop

Demo: Character Continuity Under Pressure

Run `day2/demos/01-visual-story-continuity.md`.

- Baseline: Generate a second frame from a scene-only prompt.
- Drift: Name the identity, wardrobe, prop, or style changes.
- Repair: Recreate it with the master prompt and approved reference.
- Evidence: Score both outputs with the same continuity ledger.

Live generation is optional; the demo includes an offline continuity review.

From Story Frames to Motion

Animate approved keyframes instead of rediscovering the story

Move from Still Image to Video

1. Approve the story bible and storyboard.
2. Generate and review a keyframe for each shot.
3. Animate the approved keyframe where image-to-video is available.
4. Describe motion, camera behavior, duration, and sound.
5. Assemble clips, narration, music, and captions in Google Vids.

Do not ask one long prompt to solve identity, story, motion, and editing at once.

Video Prompt: Describe Motion

Animate approved Frame 2 for five seconds.
Mina remains still and studies the panel. Orbit glides 20 cm left to right while its cyan ring pulses twice. The scan follows that path across the panel. Slow camera push-in; no cut or zoom. Preserve faces, hands, clothing, props, station geometry, palette, and gouache texture. No dialogue, text, logo, or new object. End with Orbit stationary so Frame 3 can begin from that pose.

The keyframe defines appearance; the video prompt defines change over time.

Design the Shot Handoff

Outgoing shot	Incoming shot	Continuity handle
Orbit stops beside the panel	Mina reaches toward that panel	Match object position
Mina looks screen-right	Cable appears screen-right	Match eyeline
Cyan ring pulses twice	Station lights activate	Repeat color cue
Camera ends close	Next shot starts medium	Preserve geography

Plan the final moment of one clip as the first constraint of the next.

Keep Sound Continuous Too

Lock a small audio bible:

- Narrator voice, pace, pronunciation, and loudness
- Character names and approved terminology
- Music motif, instrumentation, and transition points
- Ambient sound and intentional silence
- Caption wording and timing

Review the assembled timeline; polished clips can still create a confusing story.

Demo: Storyboard-to-Video Handoff

Run `day2/demos/02-storyboard-video-handoff.md`.

- Inputs: Use two approved adjacent keyframes.
- Motion: Animate only the action between the frames.
- Handoff: Match prop position, eyeline, lighting, and end pose.
- Assembly: Add reviewed narration and captions in Google Vids.

If video generation is unavailable, compare the prepared shot plan.

Audio, Speech, and Music

Distinguish knowledge synthesis from creative production

Three Different Audio Jobs

Job	Enterprise option
Understand a recording	Gemini media analysis
Turn sources into a briefing	Audio Overview
Narrate approved copy	Google Vids voiceover or speech API
Hold a live voice interaction	Gemini Live API

Choose based on evidence, latency, control, and publishing needs.

Audio Overviews

Audio Overviews create podcast-style conversations from supported sources such as documents, slides, notebooks, and research reports.

They are useful for:

- Executive pre-reads and learning reinforcement
- Alternate consumption of approved content
- Discovering questions before a live briefing

They are synthesized explanations, not recordings of the source.

Generate Music with Lyria

Eligible Gemini Apps and Google Vids accounts can create music with Lyria.

A prompt may use text, images, or video as creative context and specify:

- Genre, instrumentation, tempo, and mood
- Duration, structure, vocals, or instrumental mode
- Business purpose and prohibited elements

Full-track and usage access depends on the selected model and plan.

A Reusable Music Brief

Create a [duration] [instrumental/vocal] track for [purpose].
Mood: [three adjectives]. Tempo: [range].
Instrumentation: [approved palette]. Structure: [sections].
Leave room for narration and end with [transition].
Do not imitate a named artist or reuse protected lyrics.

Review lyrics, pronunciation, cultural context, rights, and brand fit.

Audio Workflow (Learning and Development)

REAL-WORLD SCENARIO

Internal policy rollout:

- Create an Audio Overview from the approved policy and FAQ (frequently asked questions).
- Produce a short Vids explainer with reviewed voiceover copy.
- Add generated music only when it improves comprehension.
- Publish the policy itself as the authoritative source.

Generate and Produce Video

Match quick ideation, collaboration, or API scale

Three Routes to Video

- **Gemini Apps:** Generate or refine short media from a conversation.
- **Google Vids:** Plan, assemble, edit, collaborate, and share at work.
- **Enterprise Agent Platform:** Build repeatable workflows with Veo, Omni, and APIs.

A generated clip is a production ingredient, not a completed campaign.

What Google Vids Adds

A Vids workflow can combine:

- A prompt and approved Drive sources
- A suggested outline and scenes
- Stock, uploaded, or generated media
- Scripts, AI (artificial intelligence) voiceovers, music, and avatars
- Collaborative editing and sharing

The team still owns the final narrative and approval.

Build a Video Brief

Specify:

1. Audience, goal, duration, and aspect ratio
2. Subject, setting, action, and continuity
3. Shot, camera movement, lighting, and pacing
4. Dialogue, narration, music, and sound
5. Brand, safety, factual, and rights constraints
6. Required captions and final approvers

Video Workflow (Change Management)

REAL-WORLD SCENARIO

Internal system launch:

- Ground the storyboard in approved launch documents.
- Generate only the scenes that stock or recorded media cannot provide.
- Review UI depictions, dates, claims, narration, and captions.
- Require the system owner and communications lead to approve release.

Enterprise Governance

Keep control across input, generation, review, and publication

Know the Workspace Trust Boundary

For qualifying Workspace editions, Google states that:

- Interactions stay within the organization.
- Existing Workspace protections apply.
- Content is not human reviewed or used to train generative AI models outside the domain without permission.

Do not extend these assurances to personal accounts or unapproved tools.

Administrators Control Access

Admins can manage access to:

- The Gemini app
- Connected Workspace services
- Gemini features inside Workspace apps
- Google Vids and its generative features
- Organizational units, groups, and eligible licenses

Validate the classroom account before promising a feature.

Provenance Helps, but Is Not Approval

Google uses technologies such as SynthID and Content Credentials across supported generated media.

They can help establish origin or editing history, but they do not prove:

- Factual accuracy
- Ownership of every input
- Brand suitability
- Legal permission to publish

Production Approval Workflow

1. Approve the purpose and source assets.
2. Minimize sensitive input data.
3. Generate from a documented brief.
4. Review facts, quality, accessibility, safety, and rights.
5. Check provenance and disclosure.
6. Record the owner who authorizes publication.

Media Review Gates

Applied Activity: Choose a Surface

Your team needs an internal two-minute launch explainer grounded in an approved policy and slide deck.

Choose one:

- A. Generate everything in a personal Gemini account
- B. Build and review it collaboratively in Google Vids
- C. Create a custom media-generation API before testing the message

Commit to an answer and name one required approval.

Applied Activity: Recommended Answer

Choose B: Google Vids.

- It fits collaborative workplace production.
- Approved Workspace sources can inform the storyboard.
- Scripts, voiceovers, visuals, and music remain editable.
- Review and sharing stay in the team workflow.

Use an API only when repetition, integration, or scale justifies it.

Feature Availability Changes

Before delivery or deployment, verify:

- Workspace edition and assigned access
- Admin settings and connected services
- Country, language, age, and rollout restrictions
- Current generation limits and model status
- Retention, sharing, and publishing policy

Capability check: 27 August 2026

Breakout Lab 2.1: The Visual Storyboard

Open `day2/breakout-visual-storyboard/` in the companion repo.

Goal: Create an anchor keyframe, generate a second frame, and document visible continuity drift.

1. Complete the story bible and approve one anchor.
2. Generate Frame 2 from a bounded scene delta.
3. Score both frames and repair the highest-impact defect.

Preserve passing details and record one publication risk.

Official References (1/2)

- Work and school account capabilities
- Upload and analyze files
- Generate and edit images
- Generate videos
- Generate music

Official References (2/2)

- [Gemini features in Google Vids](#)
- [Workspace privacy hub](#)
- [Google Cloud generative media](#)
- [Lyria enterprise documentation](#)

Key Takeaways

1. Gemini can analyze and generate across images, audio, music, and video.
2. Gemini Apps, Google Vids, and enterprise APIs serve different operating needs.
3. A detailed creative brief makes generated media easier to evaluate.
4. Enterprise controls reduce risk but do not replace human approval.
5. Verify current licenses, limits, provenance, rights, and facts before publishing.
