

Gemini Pro

Gemini Notebook: Capstone and Workflow Integration

Day 2 - Session 18

What We'll Cover

1. Define the capstone evidence contract
2. Integrate Notebook with Gemini and Workspace handoffs
3. Assign ownership, sharing, and maintenance controls
4. Complete Breakout Lab 2.6: End-to-End Application
5. Review evidence, share insights, and close the course

The Capstone Contract

Show controlled evidence, not only polished output

Use a Fresh Topic

Choose a non-sensitive work or study topic such as:

- Employee onboarding
- Product launch readiness
- Client or market briefing
- Professional development

Do not reuse the policy notebook from the previous three labs. Demonstrate transfer.

Define Before You Import

Record:

1. Audience
2. Decision or learning goal
3. Final deliverable
4. Notebook owner
5. Prohibited data

A clear contract keeps the source set and artifact scope bounded.

Required Capstone Evidence

- At least three diverse, inspected sources
- One checked cross-source answer
- One correction, rejection, partial claim, or unresolved issue
- One verified note and reviewed study guide
- One reviewed multimedia artifact
- Ownership, permission, maintenance, and archive decisions

The judgment correction is required evidence of human review.

Score Evidence Above Polish

Strong submission	Weak submission
Simple artifact with checked claims	Impressive media with unchecked claims
Source authority and freshness recorded	Many sources selected without purpose
Correction or unresolved issue preserved	Fluent answer accepted without review
Owner and maintenance trigger assigned	Share link with no lifecycle plan

End-to-End Notebook Workflow

Integrate the Workflow

Move evidence between products without losing control

Choose the Surface by Task

Need	Product or handoff
Controlled synthesis	Gemini Notebook source-grounded chat
Web, code, or broader tools	Eligible agentic chat or Gemini Apps
Verified analysis	Notebook notes
Report or data table	Reviewed export to Docs or Sheets
Editable presentation or video	Slides or Vids after evidence approval

Label the Evidence Boundary

For each output, record:

- Product and chat mode used
- Selected notebook sources
- Outside web evidence or tools
- Calculations and transformations
- Human interpretation and approval

A synchronized notebook does not make every surface use the same evidence.

Evidence Boundary at Handoff (Fintech)

REAL-WORLD SCENARIO

Fintech (Intuit: QuickBooks):

- A finance team can carry source names, verification dates, and approval notes from a notebook into a reviewed Docs or Slides briefing about small-business cash flow.
- A receiving owner rechecks claims after export because the presentation is a copy, not a synchronized evidence layer.

Evidence Boundary at Handoff (Manufacturing)

REAL-WORLD SCENARIO

Manufacturing (Siemens: Industrial Copilot):

- An engineering team can move verified maintenance findings into a governed work instruction or training deck while retaining source references.
- The receiving owner confirms equipment scope and permissions before the exported artifact reaches plant operators.

Workspace Handoffs Create Copies

Preserve Traceability at Handoff

When moving to Docs, Sheets, Slides, or Vids:

1. Carry source names and citations.
2. Record the verification date.
3. Assign the receiving owner.
4. Review destination permissions.
5. Recheck claims after material edits.

Exports do not synchronize changes back to the notebook.

Choose the Smallest Useful Artifact

- Use a study guide when the audience needs reference material.
- Use audio when people need a reviewed listening format.
- Use an infographic for a bounded timeline or relationship.
- Use video when motion or visual explanation adds real value.
- Use Slides or Vids for collaborative production and maintenance.

Generation effort should not displace evidence review.

Operate the Notebook

Access and maintenance determine whether the artifact stays trustworthy

Viewer and Editor Are Different Jobs

Role	Capability
Viewer	Reads shared sources, notes, and artifacts
Editor	Adds or removes material and may share further

Give Editor access only to people responsible for maintaining the evidence set.

Chat View Is Not a Security Boundary

Chat View can focus the learner experience, but it does not reliably revoke access to underlying sources and artifacts.

If an audience must not see a source:

1. Remove the source from the shared notebook, or
2. Create a separate audience-safe notebook.

Do not rely on interface hiding to enforce confidentiality.

Every Notebook Needs a Maintenance Contract

Assign:

- Owner and backup owner
- Last verification and next review date
- Source owners and synchronization status
- Trigger events for re-review
- Exported artifact inventory
- Archive or deletion rule

A source update can make an approved artifact stale.

Maintenance Contract (Fintech)

REAL-WORLD SCENARIO

Fintech (Stripe: Radar):

- A fraud-operations notebook assigns owners for model notes, policy sources, review dates, and exported analyst guidance.
- A threshold or policy change triggers citation review and artifact refresh before the guidance is reused.

Maintenance Contract (Manufacturing)

REAL-WORLD SCENARIO

Manufacturing (Bosch: Nexeed connected manufacturing):

- A plant notebook records source owners, sensor-data freshness, the next review date, and the equipment scope of each artifact.
- A machine change or revised procedure triggers re-verification before a training document remains in circulation.

Notebook Maintenance Loop

Analytics Measures Adoption

Qualifying shared notebooks can report users and queries per day.

Analytics can show:

- Whether the intended audience uses the notebook
- When activity increases or fades
- Whether another training intervention may help

It cannot prove that answers are accurate. Sample citations and review defects.

Build and Review

Complete the workflow with evidence at every stage

Breakout Lab 2.6: End-to-End Application

Open `day2/breakout-end-to-end-application/` in the companion repo.

Goal: Build a fresh notebook with verified analysis, study aids, multimedia, and governance.

1. Import and classify at least three sources.
2. Verify one cross-source answer and document a correction.
3. Create reviewed artifacts and a maintenance contract.

Use the fictional energy-monitor pack if needed.

Capstone Run of Show

Minutes	Work
0-15	Define, create, source, and inspect
15-27	Interrogate and verify citations
27-37	Save notes and create a study guide
37-47	Generate and review multimedia
47-54	Complete governance and maintenance
54-60	Peer review and evidence share

Midpoint Evidence Check

At minute 27, show a peer:

- One source classification
- One opened citation
- One evidence status
- One correction or unresolved question

Do not start the multimedia artifact until these four items exist.

Peer Review Rubric

Confirm:

1. Sources are permitted, diverse, and classified.
2. Citations support the retained claims.
3. One judgment correction is visible.
4. Study and media artifacts preserve the evidence.
5. Ownership, permissions, and review triggers are recorded.

Volunteer Share

In 60 seconds, present:

1. Audience and decision
2. One checked citation
3. One correction or unresolved issue
4. One artifact review result
5. One maintenance action

Share evidence of judgment, not a tour of every feature.

Your Reusable Daily Workflow

1. Define the decision and data boundary.
2. Inspect and select sources.
3. Ask for evidence, conflict, and gaps.
4. Verify before saving or transforming.
5. Review every artifact in its modality.
6. Share through the correct boundary.
7. Maintain or archive with an owner.

Key Takeaways

1. A strong notebook workflow starts with an evidence and ownership contract.
2. Product handoffs create new permission and freshness boundaries.
3. Viewer, Editor, and Chat View choices affect real source access.
4. Maintenance triggers keep notes, artifacts, and exports aligned with sources.
5. Human correction is a required capstone deliverable, not a failure.

Course Complete

Keep the sources traceable, the judgments visible, and the owner accountable.
